AI Emotion

CASTRO, STACEY
DE SILVA, IRENE
DELA CRUZ, EUNICE
GUCE, ANGELYN

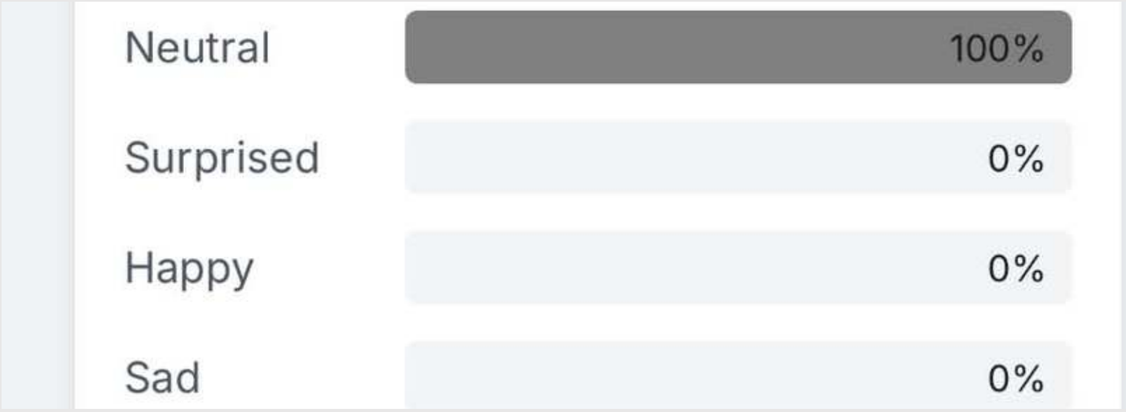

introduction

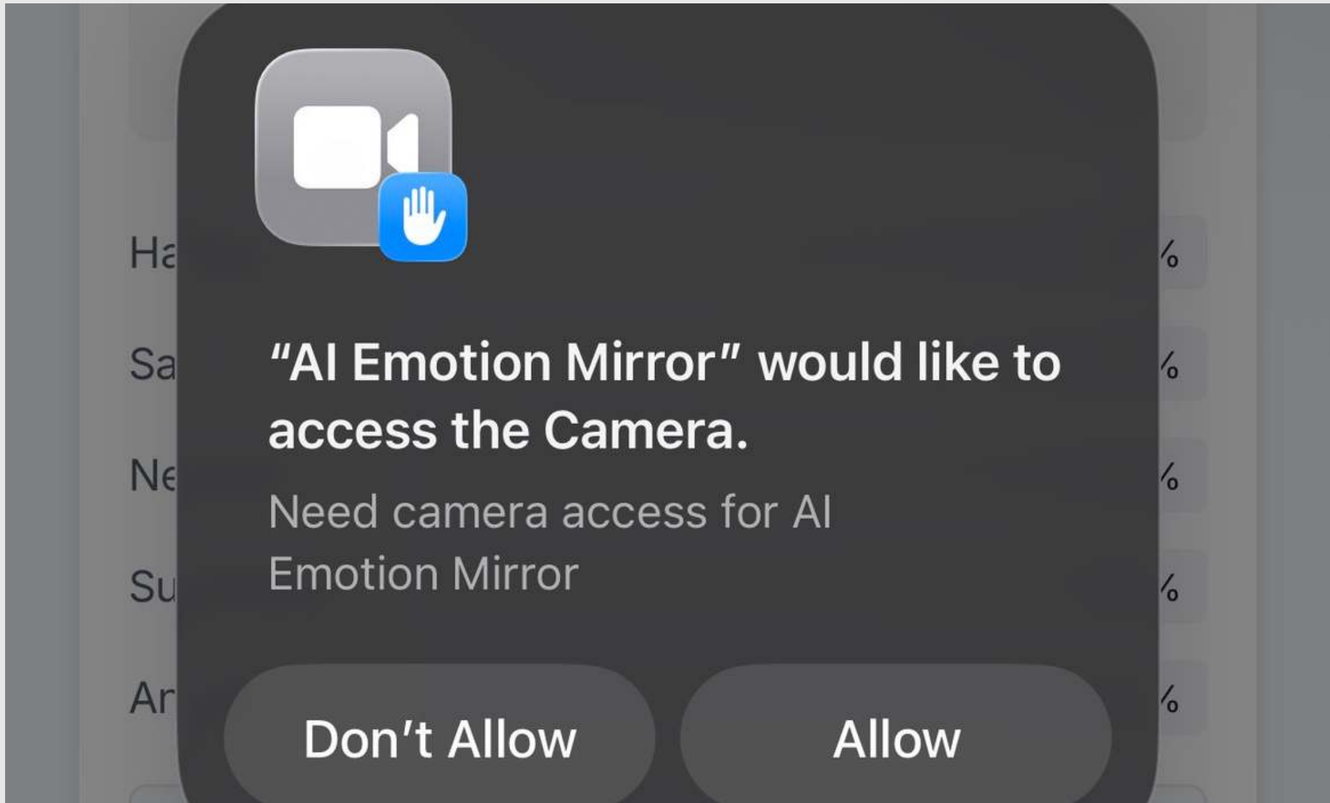

It uses our phone camera and simple AI to look at our face and guess our mood.

how it works?

- The app finds the face on the screen using the front camera.
- It checks key areas like the eyes, mouth, and eyebrows.
- It measures these parts and shows what emotion we are making in real time

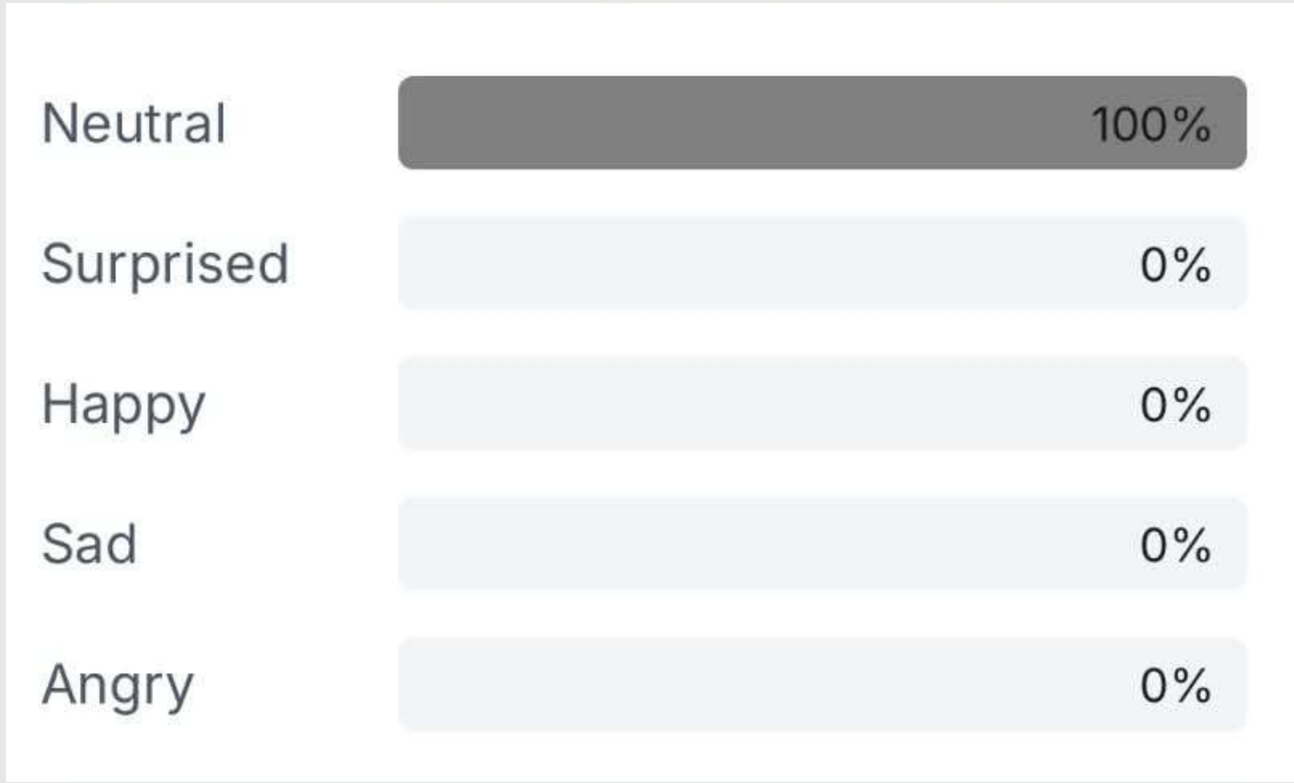

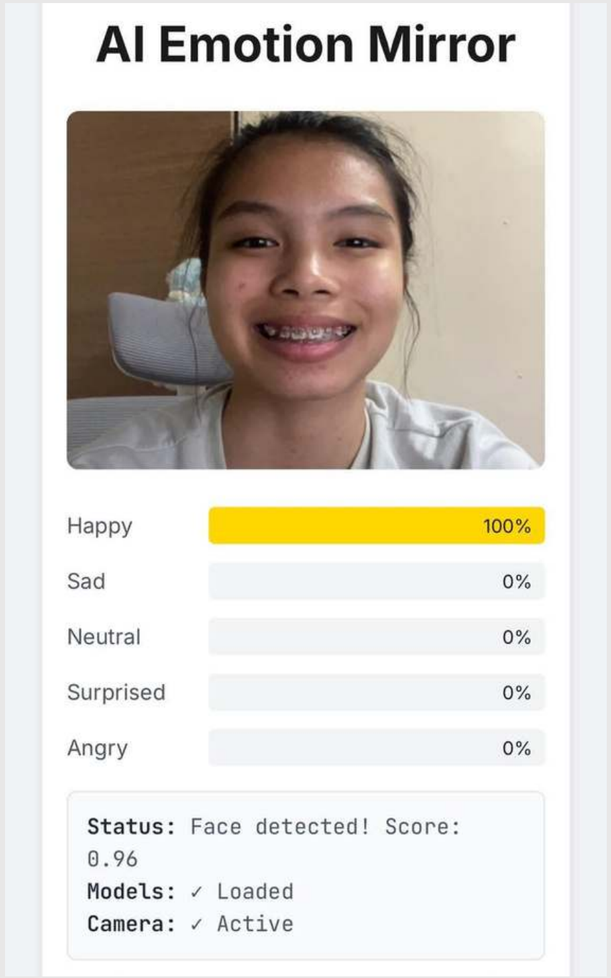

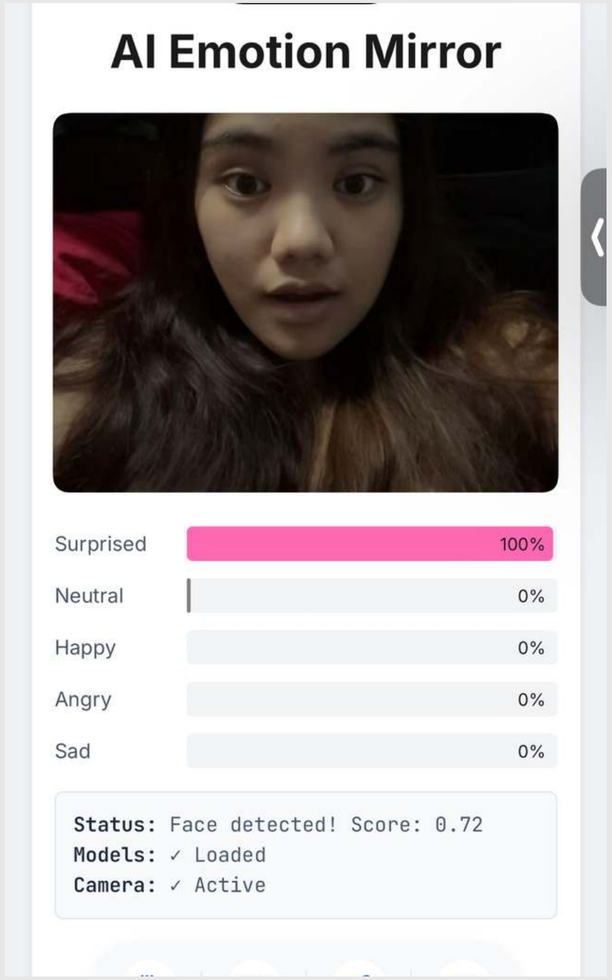

How many emotion does it recognize?

Total Emotions: 5 basic emotions.

- **Happiness**
- **Sadness**
- **Surprise**
- **Anger**
- **Neutral**

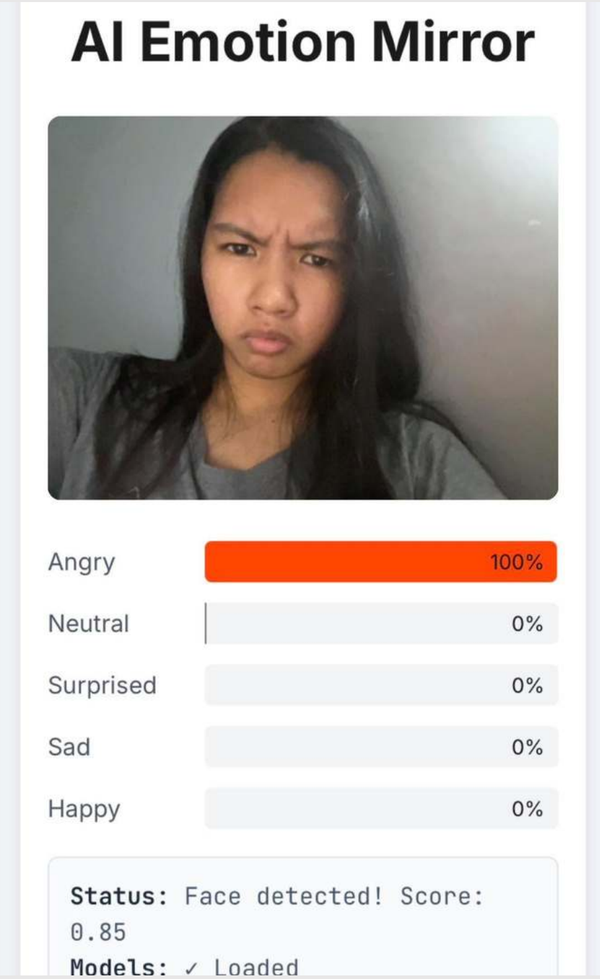

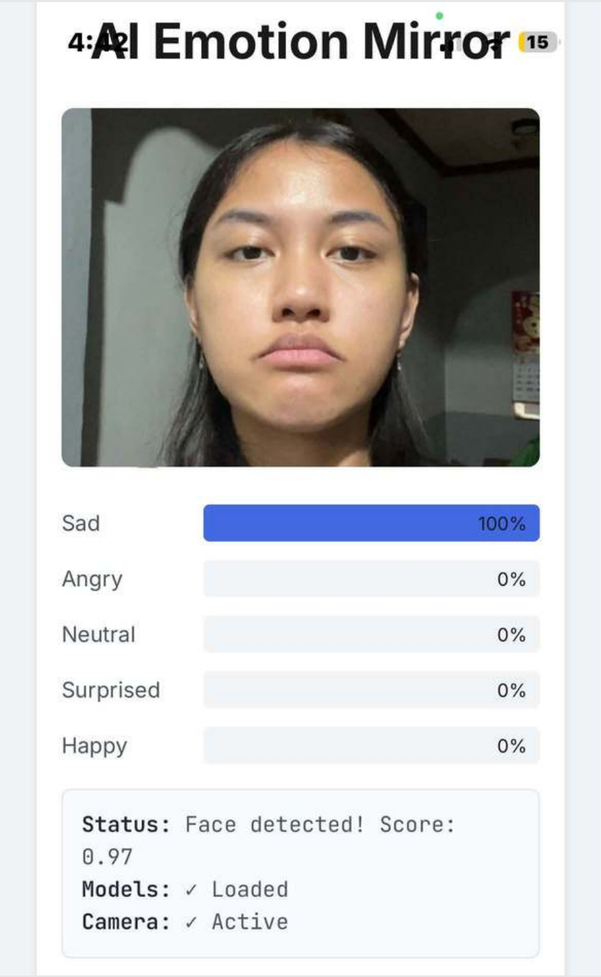

Happy and Surprised:

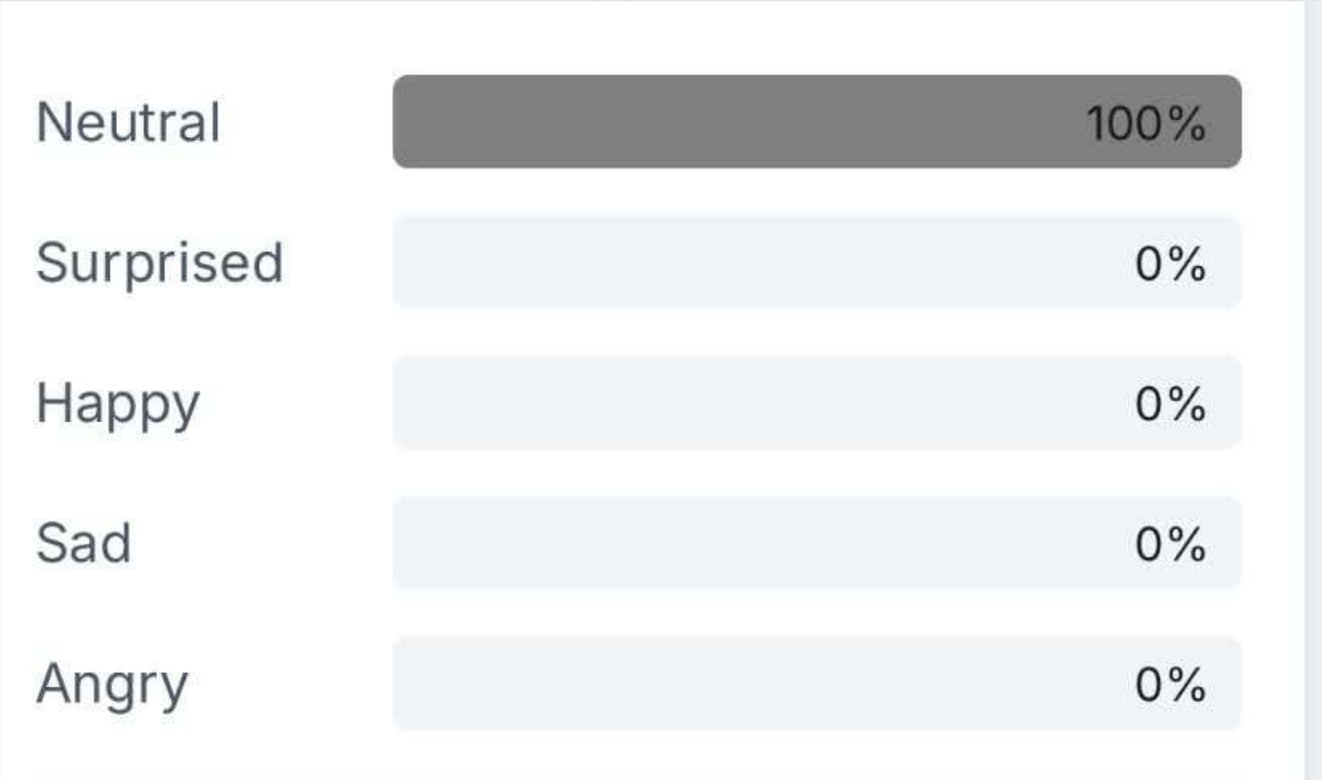

These two are very easy for the app to spot. Making a big smile or opening eyes wide gives a quick and accurate result every time.

Anger and Sadness:

These work okay, but group members had to make a very big frown or scrunch up their brows for the app to see it.

Fear and Disgust:

Since the app does not have specific categories for fear or disgust, it usually gets confused and labels them as surprise or anger.

Beard and Facial Hair Test

- **Test Result:**

Yes, having a beard or thick mustache makes it harder for the app to guess emotions correctly.

- **Why It Happens:**

Facial hair covers up parts of the mouth, jawline, and lip corners.

- **Borcelle International Company**

Because the app cannot clearly see the outline of the lips, it often labels a smiling person with a beard as "neutral" instead of "happy".

Testing in a Natural Setting

- **Test Result:**

The app does not work well when people act normally and do not pose.

- **Why It Happens:**

In real life, people do not make big dramatic faces when they are just sitting, talking, or working.

- **Borcelle International Company**

Most everyday face expressions were labeled as "neutral". Also, moving the head, bad lighting, or turning sideways made the app lose track of the face entirely.

Ethical and Privacy Issues

- **Data Privacy:**

This app states that it does not save photos, but many other apps take face scans and send them to online servers without clear warnings.

- **Consent:**

People can easily use face detection tools to scan someone's face in public without asking for their permission first.

- **Fairness:**

Emotion detection tools can make mistakes or give wrong answers depending on a person's age, skin color, or face structure.

Practical Uses in Real Life

- **Stores and Business:**

Companies can use this to see if customers look happy or bored when watching an ad or trying a product.

- **Car Safety:**

Cars can track the driver's face to check if they are getting sleepy or mad, helping to prevent road accidents.

- **Video Games:**

Games can change their difficulty or story depending on whether the player looks scared, excited, or confused.

thank you
